What went well?

The process of creating the RTM went very well. I enjoyed the process of researching multiple documents and boiling it down into requirements and related data. The process of finding elements on the page went well and then interacting with them went well. Lastly, I Really liked watching the test automation after completing all the tests.

- Creating Requirement traceability matrix
- Finding and utilizing web elements
- Watching the end automation

What needs to be improved upon?

Something I had a lot of trouble with was creating the test environment for my project. This included connecting the database to the project. I spent far too long trying to configure that. I also need to work on my knowledge of hooks. They were very helpful and important during the testing, and I didn't use them right away. I also need to work on Using both explicit and implicit waits. I need to work on reaching out for help earlier.

- Creating the testing environment
- Knowlege and application of hooks
- Implicit and explicit waits

What still needs to be accomplished?

I really didn't utilize my Jira board well. For the next sprint, I want to rearrange some things. I'd also like to go back and rename my tests and variables to more easily understood terms. To improve I'd like to take more time coming up with the steps toward each goal and remember that there is more than just one happy and sad path. For example, I think I only have added the planet's happy path with an image. It would be worth testing without one as well.

- Jira board
- More than one happy and sad path
- Testing and variable formatting and naming
- More Indepth tests

- Reach out for help sooner
- Implement a screenshot
- Visible password?
