Is the intended use of this service intuitive?

The Planetarium application is designed for users to be able to store, add and delete their planetary findings in the application. It has a very intuitive design in order to make this process simple and easy. The add and delete form is responsive to the User selection of object, IE moon or planet.

Is the service easy to use?

Yes, the service is very easy to use. It's got a very simplistic layout that makes it universally appealing. The login and logout are simple . When an action is done incorrectly, they provide those corrective alerts. The home page has the simple layout up top with the little drop down to change whether you're actions pertain to moons or planets. The fields change depending on what is selected. This makes it very easy to create and delete planets because The application responds to what you have selected. To create or delete.

Does the service inspire confidence?

The application inspires confidence by delivering a well-integrated application that allows the creation and deletion of planets and moods. But the application does contain some bugs including the ability to delete other users moons. This does not inspire confidence. Along with some absences of necessary informative alerts. This application could use some more work before it is ready for public use.

Is the service pleasing to look at?

I would say the service is a bit congested The starry night background and the translucent backing to the home page make it very difficult to pick out Certain aspects of the application and is very distracting.
